

INVESTOR PACK

CURRENT PROTOTYPE DIRECTION

Investor Overview

A commercially serious view of Corentis as product infrastructure for policy-controlled AI deployment.

PACK SUMMARY

This pack compresses the investment case into one readable flow: category need, why now, the financial-services wedge, the product logic, and what exists now versus what is still being validated. It is written to support a serious investor conversation without inventing traction, customers, or maturity.

Investment case at a glance

CATEGORY NEED

AI adoption is becoming a control problem.

Regulated organisations increasingly see AI value, but rollout slows when policy, approval, escalation, and evidence are handled outside the workflow.

WHY NOW

The commercial pressure is visible.

McKinsey estimates generative AI could create \$200bn-\$340bn in annual value for banking, mostly through productivity gains.

TIMING

EARLY BUYER PAIN

The first wedge is complaints control.

The V1 demo shows how a complaint can move from policy to controls, advisor guidance, blocked unsafe actions, escalation, and evidence.

WEDGE

One workflow where cost, risk, and service pressure meet.

Complaints handling is repeatable, review-heavy, commercially painful, and easy for operations, risk, and compliance teams to understand.

PRODUCT LOGIC

Policy Composer is the core product idea.

Plain-English policy becomes operational controls: what AI may do, when approval is required, when escalation triggers, and what evidence is recorded.

From first workflow to wider platform value

INITIAL WEDGE**LAND****Start where the operating pain is already visible.**

The first repeatable workflow is one where AI already looks useful, but internal rollout is slowed by approval steps, escalation conditions, and the need for review-ready evidence.

WHY IT CAN CONVERT**BUYER FIT****The buyer does not need to be convinced that governance matters.**

The first commercial case is easier to make because review friction, evidence gathering, and internal challenge already exist inside the operating model.

01

Land

Win one workflow where approval friction and evidence burden are obvious.

>

02

Prove

Show a cleaner path from pilot to governed use.

>

03

Expand

Extend the same control layer into adjacent workflows with similar needs.

REVENUE PATH**A realistic route from first use case to broader infrastructure adoption.**

The commercial path begins with one workflow brief and expands into neighbouring workflows that need similar control mapping, approval logic, runtime visibility, and evidence reuse.

What exists now and what is being validated

EXISTS NOW

Illustrative workflow surfaces

The current materials already show control views, evidence framing, workflow diagrams, and review-ready exports.

CURRENT FOCUS

Buyer fit and proof design

Validation is focused on which workflow lands first and what serious buyers need to see before deployment.

NEAR-TERM

Sharper workflow and design-partner learning

Current work is intended to turn conversations into clearer workflow focus, stronger packs, and a tighter pilot-to-revenue path.

WHAT IS BEING SHOWN HONESTLY

A serious early-stage company, not invented traction

Corentis is being presented as an early product company. The pack is designed to make the commercial logic legible while avoiding false signals around live customers, formal approvals, or mature enterprise rollout.

Why continue the conversation

CATEGORY

The need is becoming easier to see

Governed deployment is starting to look like infrastructure rather than a temporary compliance patch.

COMPANY

The product logic is taking shape

Corentis already presents a coherent wedge, clear scope, and product-style proof rather than a broad abstract thesis.

CONVERSATION

The next discussion should be specific

A useful investor conversation is likely to focus on workflow wedge, early buyer, proof requirements, and what turns the first deployment path into recurring revenue.

CLOSING INVITATION

If the category thesis is interesting, the next step is a serious conversation.

Corentis is building the policy plane for regulated AI. If the question is whether governed deployment becomes a real category need, the next conversation should be about first workflow entry, proof thresholds, and what this can become as product infrastructure.
